\* **Photoshop Elements**. A popular and inexpensive Photoshop alternative that includes both editing and creating new images, including JPEGs, TIFFs, PSDs, PDFs, and EPS, is Photoshop Elements. Because it focuses more on editing than creating, it provides a simplified interface with fewer choices than Photoshop. The number of options and settings is reduced, and users may be asked to do things in a different order when they are accustomed to a different image editor. Elements also offers a slew of useful tools for professionals. For example, it offers real-time editing capabilities, photo-editing retouching tools, advanced color correction, advanced painting, collage tools, and more. \* **GIMP**. For people who are happy with the highly-customizable capabilities of GIMP (GNU Image Manipulation Program), the multi-platform open source image editing and creating application is another option. GIMP is more limited in some areas than Photoshop or Elements, and has relatively fewer tools and applications, but many die-hard GIMP users won't care. \* **Fiery**. Fiery is a free Photoshop-like image editor for Windows; similar to GIMP, it has slightly fewer features and options.

Frequency distribution of base excision repair and mismatch repair gene polymorphisms in thyroid cancer: a case control study in east Iranian population. The aim of this study was to find an association between the frequency distribution of the common polymorphisms of base excision repair (BER) genes [XRCC1 [Arg194Trp], XRCC3 [Arg399Gln], XRCC2 [Arg188His], XPD [Asp312Asn] and ERCC2 [C28T], and Mismatch Repair (MMR) gene [MLH1 [G-1202A], MSH2 [A1479G], MSH6 [G1909A], PMS1 [A746G], PMS2 [T241G] and MLH3 [C111T]], and risk of developing thyroid cancer. A total of 100 cases of thyroid cancer and 240 healthy controls, from east Iranian population, were included in this study. Genomic DNA was extracted from lymphocytes and the polymorphic sites of XRCC1 Arg194Trp (rs3212986), XRCC2 Arg188His (rs1799782), XPD Asp312Asn (rs1799793), XRCC3 Arg399Gln (rs13181), and ERCC2 C28T (rs13181), were typed by using PCR-RFLP. We found that carriers of ERCC2 TT genotype had increased risk of thyroid cancer when compared to the CC genotype (OR=4.26, 95% CI=1.04-17.86). We also observed a significant result for TT genotype of XRCC3 Arg399Gln polymorphism (OR=3.00, 95% CI=1.04-8.63), compared to the GG genotype, and also a significant result for the combination of TT and GG genotypes, compared to the CC genotype (OR=4.78, 95% CI=1.32-17.33). The results suggest that genetic polymorphism of ERCC2 and XRCC3 gene in the BER pathway may be associated with increased risk of thyroid cancer. This is a quick guide to the simplest DLL to use. It's a wrapper of the new system thread function. It's not ready for general use though. To use the file, do this: put this in your DLL. If you are using MSVC, you'll need to change the DLL to have `__declspec(dllexport)` by changing your DLL project type in the MSVC project wizard. `#include extern int __stdcall MyThreadFunc(int n); void SampleFunction() { // Do stuff here }` NOTE: The `__stdcall` keyword is for applications that are compiled in 16-bit mode (for DOS only). If your application is in 32-bit mode, just omit the `__stdcall`. Add a `DEFINE_DLL` in one of the source files. That's the function that the DLL exports to the application, e.g. `#define DEFINE_DLL` this will define `DLL_EXPORT` `#include "diblib.h"` IF you have an.exe, and don't use `DEFINE_DLL`, then it wont work with a DLL. To use the functions, include the.DLL, and you should be good to go. For more, check out Another suggestion: change the calling convention to `LPTHREAD_STACK_BASE` instead of "normal" Disclaimer: I'm the author of this DLL. I was trying to wrap a system call and have found threads a bit more difficult than I was expecting.
